Worlds of Gods and Goddesses - SATURN

Alexandra Aldecoa

College of Arts and Sciences, Boise State University

SATURN

Discovered By:
1610 Galileo Galilei
& Christian Huygens **1659**

Saturn is a **GAS GIANT** just over
95 times more massive than **Earth**

The first spacecraft to reach Saturn
was **Pioneer 11** in

1797. It discovered **2** of Saturn's
outer rings, as well as the presence of
a strong

**Magnetic
Field**

Saturn's ring system is the most extensive &
complex in the solar system.

They **reflect sunlight**
which allows scientists to see the presence of
water ice. It's conceivable that the rings were
produced by the breakup of a **moon**.

Saturn has at least **62** moons.
Most of which are named after

Greek Titans
and their descendants.
